Genspark AI Image & Video Agents - Complete Guide for Claude Cowork

Document Purpose
This guide provides comprehensive information about using Genspark's AI Image and AI Video generation agents effectively. It's designed to help Claude Cowork guide you toward optimal usage of these tools for creative content generation.

QUICK START GUIDE: AI AVATAR FOR TIKTOK & INSTAGRAM

Your 3-Step Path to Avatar Content Creation

This section fast-tracks you to creating professional AI avatars for social media, UGC content, and video xPrompt Dos and Don'tsment workflows.

Step 1: Choose Your Avatar Creation Method

Option A: Avatar Image + Video Synthesis (Recommended for most creators)
1. Use AI Image to generate hero avatars with consistent styling (see "Real-World Avatar Templates" below)
2. 2. Use those images in AI Video with Gemini Veo 3.1 Reference model
3. 3. Result: Professional avatar-driven content in 4-8 seconds

Option B: Direct Video Generation (Fastest approach)
1. Write a detailed avatar description prompt
2. 2. Use Gemini Veo 3.1 with Auto Prompt enhancement
3. 3. Generate 4-8 second clips directly
4. 4. Compile into TikTok/Instagram reels

Step 2: Select Your Models for Best Results

For Avatar Images:
- **Nano Banana Pro** (NEW) - Fastest, consistent styling across multiple generations
- - **Flux 2 Pro** - If you need photorealistic avatars for product showcase
- - **Recraft V3** - Best for consistent commercial/brand avatars

For Avatar Videos:
- **Gemini Veo 3.1** - Best audio sync and natural movement
- - **Gemini Veo 3.1 Reference** - Use your hero avatar images for style consistency
- - **Sora 2 Pro** - Most cinematic, best for premium brand avatars

Step 3: Real-World Avatar Prompt Templates

(See detailed section below for full templates)

—

UNIFIED PROMPT ENGINEERING: IMAGE + VIDEO CONSISTENCY

To create cohesive avatar content, use these universal principles for both image and video generation:

Universal Avatar Prompt Framework

Structure: [Identity] + [Setting/Context] + [Action/Emotion] + [Technical Specs]

Core Avatar Parameters (Use in BOTH Image & Video)

- **Identity Consistency:** “Professional female avatar, 30-35 years old, warm smile, confident presence”
- - **Visual Style:** “Modern, approachable, corporate professional” or “Casual, relatable, friendly”
- - **Clothing/Appearance:** Be specific: “Wearing business blazer” or “Casual creative outfit”
- - **Styling:** “Natural makeup, well-lit, professional photography”

Real-World Avatar Prompt Templates for TikTok/Instagram

Template 1: Product Showcase Avatar (UGC Style)

Image Generation Prompt:
“Professional female avatar, 25-30 years old, bright enthusiastic smile, wearing casual creative hoodie, holding a beauty product, modern minimalist background with soft bokeh lighting, natural makeup, studio lighting, professional photography, 4K, approachable and trustworthy expression, lifestyle photography”

Video Generation Prompt (using avatar image):
“Avatar holding beauty product, excited reaction showing product benefits, turning product to show details, speaking gestures, natural lighting, professional UGC style, 6 seconds, 1080p, emphasis on product visibility and avatar’s genuine enthusiasm”

Best Model Combination:

- Image: Nano Banana Pro (speed) or Flux 2 Pro (photorealism)
- - Video: Gemini Veo 3.1 Reference (uses your avatar image)

Template 2: Tech/SaaS Avatar (Educational Content)

Image Generation Prompt:

“Professional male avatar, 30-40 years old, intelligent expression, wearing smart casual (tech industry style), modern office environment, natural lighting from window, approachable but authoritative, corporate professional style, well-groomed, medium shot, studio quality”

Video Generation Prompt:
“Avatar sitting at desk, explaining tech concept with hand gestures, pointing at screen, nodding, maintaining eye contact, professional corporate environment, natural conversation style, 8 seconds, 1080p, clear audio sync for voiceover”

Best Model Combination:
- Image: Flux 2 Pro (sophisticated, professional)
- - Video: Gemini Veo 3.1 (clean, professional movement)

Template 3: Fashion/Lifestyle Avatar (Trend-Focused)

Image Generation Prompt:
“Fashionable female avatar, 22-28 years old, trendy style, wearing latest fashion trends (specify: athleisure/streetwear/minimalist), confident pose, urban modern background, professional photography, natural light, 4K, expression of style confidence, lifestyle photography”

Video Generation Prompt:
“Avatar showcasing outfit, walking pose, turning to show styling details, confident expressions, natural movement, urban setting or neutral background, 4-6 seconds, 1080p/4K, professional fashion photography style”

Best Model Combination:
- Image: Recraft V3 (stylish, commercial)
- - Video: Sora 2 Pro (cinematic movement, fashion-forward)

Template 4: Personal Brand/Influencer Avatar

Image Generation Prompt:
“Charismatic personal brand avatar, [age], distinctive personal style (specify colors/aesthetic), warm engaging smile, personal branding colors visible, lifestyle environment that matches brand identity, professional lighting, authenticity and relatability, 4K portrait”

Video Generation Prompt:
“Avatar making content creation gestures, speaking to camera with enthusiasm, hand movements for emphasis, authentic personal brand expression, [background matching brand], 6-8 seconds, 1080p, natural charisma and engagement”

Best Model Combination:
- Image: Nano Banana Pro (consistent re-creation for series)
- - Video: Gemini Veo 3.1 (natural, engaging)

Key Prompt Principles for Avatar ConsADVANCED: VIDEO What is Video PART 1: GENSPARK AI IMAGE AGENTmentistencyADVANCED: VIDEO What is Video Claude Cowork as Your Genspark Workflow Managerment

Video PART 2: CLAUDE COWORK INTEGRATIONment & Character Transfer: Complete Best Practices Guide

Video PART 2: CLAUDE COWORKment is the process of taking an existing video (with motion, choreography, or action sequences) and applying it to a new character or subject. This is particularly useful for UGC creators who want to repurpose reference footage with their own custom AI avatars, or replace characters in existing videos with new ones while maintaining natural motion.

How Video PART 3: MODEL SELECTIONment Works

The primary Genspark tool for character replacement is **Kling V2.6 Motion Control**, a dedicated feature that transfers motion from a reference video to your custom character. Rather than regenerating the entire video, Motion Control maps the movement, gestures, and choreography from the source video onto your new character image, maintaining temporal continuity and natural movement.

Method 1: Kling V2.6 Motion Control (Recommended for Character Replacement)

What It Does:
- Transfers motion, gestures, and choreography from a reference video to your custom character image
- - Preserves original pacing, flow, and movement quality
- - Maintains temporal consistency throughout the sequence
- - Best for: Reusing existing video choreography with different avatars

Requirements:
- Character image (your custom AI avatar or reference)
- - Reference video with clear motion (5-30 seconds depending on orientation)
- - Image and video should have compatible aspect ratios and character positioning

Step-by-Step Workflow:

1. **Prepare Your Character Image**
2. - Create or generate your AI avatar using Genspark AI Image agent (see “Real-World Avatar Templates”)
3. - Ensure character is clearly visible with consistent pose
4. - Use consistent lighting and background in the character image
5. - Recommended resolution: 720p minimum, 1080p or higher for best results
6. - Export as PNG or JPEG with transparent background (if possible)

2. **Select or Record Your Reference Video**
- Choose reference footage with clear, distinct movements

- - Ideally 5-15 seconds for single character motion
- - Can be up to 30 seconds for more complex sequences
- - Ensure video is properly framed with subject centered
- - Test with different orientations (vertical for TikTok, horizontal for broader use)
- - Source can be: existing TikTok/Reels, personal recordings, stock footage, or AI-generated video

3. **Set Up Motion Control in Genspark**
   - Navigate to AI Video agent
   - - Select “Kling V2.6 Motion Control” model
   - - Upload your character image
   - - Upload your reference video
   - - Adjust orientation setting (Portrait/Landscape) to match your needs
   - - Frame rate and resolution settings available in Settings
4. **Configure Advanced Settings**
   - **Aspect Ratio**: Match character image dimensions to reference video
   - - **Orientation Lock**: Specify if character should maintain portrait or landscape orientation
   - - **Motion Intensity**: Control how strictly motion is transferred (if available)
   - - **Processing Priority**: Standard vs. High quality (affects processing time)
5. **Generate and Review**
   - Click Generate/Create
   - - Processing time: 2-5 minutes depending on video length and settings
   - - Review output for: character consistency, motion accuracy, background integration
   - - If needed, regenerate with adjusted settings
6. **Export and Integrate**
   - Export as MP4 or WebM
   - - Download final video
   - - Integrate into your editing workflow for final touches

Method 2: Kling O3 Image-to-Video (For Static Image Animation)

What It Does:
- Animates static images with frame-to-frame continuity
- - Creates smooth transitions between keyframes
- - Does NOT transfer specific motion from reference
- - Best for: Creating simple character animations from multiple poses

Use Case: If you have 1-2 character poses and want to animate them into a video sequence

Specifications:
- Input: 1-2 images
- - Output duration: 3-15 seconds
- - Resolution: 720p/1080p
- - Note: Image-to-video generation only (not motion transfer)

Method 3: Kling O3 Reference-to-Video (For Style-Guided Generation)

What It Does:

- Generates video with 1-7 reference images for style consistency
- - Uses images as visual anchors for style, not motion
- - Best for: Maintaining visual consistency across generated scenes

Use Case: You want a video to match the specific look/style of your character across multiple shots

Specifications:

- Input: 1-7 reference images
- - Output duration: 3-15 seconds
- - Resolution: 720p/1080p
- - Requires image-to-video generation

—

Best Practices for Successful Character Replacement

Character Image Preparation:

- Always use high-quality avatar images (1024x1024 or higher)
- - Ensure consistent lighting between character image and reference video background
- - Match clothing and styling to the motion reference content (if doing product showcase with specific outfit)
- - Maintain similar character positioning in image (not too close/zoomed)
- - Use professional quality avatar generation for best results

Reference Video Selection:

- Choose source videos with clear, distinct movements
- - Avoid overly complex or rapid motion for first attempts
- - Test orientation: vertical works best for TikTok/Reels, horizontal for broader compatibility
- - Ensure reference video has good lighting and clear subject
- - Prefer videos where motion is centered in frame

Motion Transfer Quality:

- Simpler, slower movements transfer better than rapid/complex choreography
- - 5-15 second clips usually produce best results
- - Longer videos (15-30s) work but may accumulate slight errors
- - Character size in image should approximately match reference video subject size

Common Mistakes to Avoid:

- Using blurry or low-quality character images
- - Mismatched aspect ratios between image and video
- - Reference videos with multiple subjects (Motion Control works best with single character)
- - Overly complex dance or rapid motion in first attempts
- - Ignoring lighting consistency between components
- - Not checking orientation requirements for platform (TikTok vs YouTube vs Instagram)

—

Model Capabilities Comparison for Video Tasks

Feature	Kling V2.6 Motion Control	Kling O3 Image-to-Video	Kling O3 Reference-to-Video
—	—	—	—
Primary Purpose	Motion transfer from video	Static image animation	Style-guided generation
Input Requirements	Image + Video	1-2 images	1-7 reference images
Output Duration	5-30 seconds	3-15 seconds	3-15 seconds
Best For	Character replacement	Simple animations	Consistent styling
Resolution	Up to 1080p	720p/1080p	720p/1080p
Motion Sources	External video	Generated	Generated from reference
Processing Time	2-5 minutes	1-3 minutes	1-3 minutes

Practical Examples for Claude Cowork

Example 1: TikTok Product Showcase Avatar Swap

1. Record yourself doing product demo (30 seconds)
2. 2. Generate AI avatar using Genspark AI Image with matching outfit
3. 3. Use Kling V2.6 Motion Control with your recording as reference
4. 4. Output: Professional-looking TikTok with AI avatar performing your choreography
5. 5. Edit add text overlays, transitions, music in external editor

Example 2: Reusing Trending Choreography

1. Find trending TikTok dance (with good lighting/framing)
2. 2. Generate your branded AI avatar
3. 3. Apply Kling V2.6 Motion Control with trending video as reference
4. 4. Create multiple variations by changing avatar style (casual/professional/fashion)
5. 5. Post variations to capitalize on trend with your unique avatar

Example 3: Avatar Consistency Across Multiple Scenes

1. Generate hero avatar image (your brand character)
2. 2. Use Kling O3 Reference-to-Video with avatar as style reference
3. 3. Generate complementary video scenes with consistent avatar appearance
4. 4. Combine into cohesive video narrative maintaining visual consistency

—

Troubleshooting Character Replacement Issues

Issue: “Character doesn’t match the motion”

- Solution 1: Check aspect ratio - resize image to match video dimensions
- - Solution 2: Adjust character position in image - should be centered and occupy similar frame space as reference video subject
- - Solution 3: Try shorter reference video (under 10 seconds) for simpler motion patterns

Issue: “Motion transfer creates unnatural movements”

- Solution: Use simpler, clearer motion in reference video

- - Avoid rapid head movements or extreme gestures
- - Test with slower choreography first

Issue: “Avatar looks inconsistent frame-to-frame”

- Solution 1: Use higher resolution character image (1024px+)
- - Solution 2: Ensure consistent lighting in character image matching video background
- - Solution 3: Check that Motion Control model is selected (not basic video generation)

Issue: “Processing is very slow”

- Solution 1: Reduce video length (try 5-10 seconds instead of 30)
- - Solution 2: Lower resolution setting if available
- - Solution 3: Simplify character image (remove complex background details)Video Replacement & Character Transfer

ACEMENT

1. **Appearance Lock:** Always include specific physical descriptors (age, gender, distinctive features)
2. 2. **Emotional Consistency:** “Warm,” “confident,” “approachable” - maintain the same tone
3. 3. **Context Matching:** Video background/setting should echo the image’s aesthetic
4. 4. **Action Clarity:** Be specific: “holding,” “pointing,” “gesturing” not vague “talking”
5. 5. **Technical Quality:** Always specify resolution and style (“professional photography,” “studio lighting”)
6. 6. **Avoid:** Generic avatars, inconsistent styling, unrealistic physics, contradictory emotions

Prompt Dos and Don’ts

DO:

- Be highly specific about appearance and context
- - Use adjectives that repeat across image + video (“warm,” “professional,” “confident”)
- - Specify the emotion/action clearly
- - Include technical quality markers (“4K,” “professional photography”)
- - Test variations and note what works best for your avatar style

DON’T:

- Use vague descriptions (“nice person,” “good looking”)
- - Change fundamental appearance between image and video
- - Forget to specify action/movement in video prompts
- - Use conflicting styles (“professional” + “casual fun” in same prompt)
- - Expect perfect consistency without testing iterations

—

PART 2: CLAUDE COWORK INTEGRATION & GENSPARK WORKFLOWS

Claude Cowork as Your Genspark Workflow Manager

Claude Cowork can significantly accelerate your Genspark usage by managing prompts, coordinating multi-step workflows, and handling iteration cycles. Rather than manually navigating between Genspark and describing tasks repeatedly, Claude can:

- Generate and refine video/image prompts before submission
- - Manage iterative improvements based on output quality
- - Track multiple projects and maintain consistency across variations
- - Optimize your workflow based on content type and platform targets
- - Handle batch processes for efficient content creation

How to Brief Claude Cowork for Genspark Tasks

Clear Task Structure:
When asking Claude to work with Genspark, provide:

1. **Content Goal**: What are you creating? (e.g., “TikTok product showcase”, “Instagram Reel”, “YouTube avatar video”)
2. 2. **Output Specifications**: Platform (TikTok/YouTube/LinkedIn), duration (6-15 sec for social), format (vertical/horizontal)
3. 3. **Quality Targets**: Visual style (photorealistic/stylized), consistency requirements
4. 4. **Action Steps**: Should Claude use Auto Prompt, Super Agent, or manual prompts?
5. 5. **Iteration Rules**: When should Claude ask for feedback vs. proceed independently?

Example Brief:
“Create a 15-second TikTok product showcase video featuring an AI avatar. Use Genspark Super Agent to generate prompts automatically. The avatar should be professional and consistent. If the first output isn’t perfect, refine the prompt and generate 2 variations. Then ask me which one works best.”

Claude Cowork + Genspark’s Super Agent Feature

Genspark’s **Super Agent** can automatically generate optimized prompts, which means Claude can focus on high-level direction while the AI handles technical prompt engineering:

Workflow:

1. Claude receives: “Create a luxury product demo video”
2. 2. Claude briefs you on approach and provides brief description
3. 3. Claude uses Genspark Super Agent: Input simplified description like “Product demo: luxury watch, professional woman, elegant setting”
4. 4. Super Agent expands this into full technical prompt
5. 5. Claude submits to appropriate model
6. 6. Claude evaluates output and refines if needed

Benefit: Eliminates manual prompt engineering while maintaining quality control.

Claude Cowork + Auto Prompt Feature

For image generation, Genspark's **Auto Prompt** feature automatically enhances descriptions:

When to Use:
- Quick avatar creation (less critical precision)
- - Exploratory variations
- - When you're unsure about exact specifications

When NOT to Use:
- Highly specific brand consistency requirements
- - Complex scenes with multiple subjects
- - When exact visual details matter

Claude's Role:
- Disable Auto Prompt for detailed character work
- - Enable Auto Prompt for rapid iteration/exploration
- - Evaluate if enhanced prompts achieve your goal

Step-by-Step: Claude Cowork + Genspark Integration

Scenario: Creating 5 Avatar Variations for A/B Testing

1. **Discovery Phase**
2. - You: "I need 5 avatar variations of a professional woman for product videos. Different styles: casual, corporate, luxury, energetic, friendly."
3. - Claude: Confirms specifications, suggests best models (Flux 2 Pro for variety)

2. **Prompt Generation Phase**
- Claude creates base description: "Professional woman, [style], clean background, product-focused, 1080p"
- - Claude uses Genspark Super Agent to optimize for each style
- - Claude submits all 5 to Genspark in batch

3. **Evaluation Phase**
- Claude reviews outputs for: consistency, quality, platform suitability
- - Claude notes which variations work best and why
4. **Refinement Phase**
5. - Claude identifies 2-3 variations needing improvement
6. - Claude refines prompts (e.g., "More sophisticated styling", "Add confidence in expression")
7. - Claude regenerates specific variations

5. **Selection Phase**
- Claude presents all options with recommendations
- - You choose top 3 for video generation

6. **Video Creation Phase**
- Claude prepares video prompts using chosen avatars
- - Claude submits to Video agent with motion settings
- - Claude tracks outputs and suggests best takes

Setting Up Claude for Optimal Genspark Management

Information Claude Needs:

- Your brand guidelines (colors, style, tone)
- - Target platforms and their specifications
- - Budget/credit limits (if applicable)
- - Preferred models for different task types
- - Your quality threshold (when to regenerate vs. accept)

Example System Setup:

“Claude, here’s how to manage my Genspark account:

- Avatar quality: Must be 1024x1024+ and photorealistic
- - Video specs: Prefer Kling V2.6 for motion, Gemini Veo 3.1 for cinematic scenes
- - Platform: Focus on TikTok (9:16, 15-30 sec, energetic style)
- - Budget: Prioritize efficiency, generate variations only when first attempt is poor quality
- - Decision rule: If output is >80% acceptable, proceed. If <70%, regenerate with prompt adjustment.”

—

PART 3: MODEL SELECTION DECISION TREE FOR GENSPARK CREATORS

When to Use Which Model: Complete Decision Framework

Rather than guessing, use this decision tree to select the optimal model for your specific need. Genspark offers Auto-Select mode (which intelligently picks models), but understanding these decisions helps you override auto-select when you have specific requirements.

Decision Tree 1: IMAGE GENERATION

Start with: **What do you need?**

```
**AVATAR/CHARACTER CREATION**
└─ Need photorealistic human?
   ├─ YES → Need high consistency across multiple generations?
   │  ├─ YES → **Flux 2 Pro** (best photorealism + consistency)
   │  └─ NO → **Nano Banana Pro** (faster, good quality, sufficient variations)
   └─ NO → Need stylized/artistic avatar?
      └─ **Seedream 4.5** or **GPT Image 1.5** (artistic control)

**PRODUCT PHOTOGRAPHY**
└─ Need professional product shots?
   ├─ YES, must be photorealistic → **Flux 2 Pro**
   ├─ YES, editorial/lifestyle → **Seedream 4.5** (stylistic)
   └─ Need fast processing → **Z-Image Turbo**

**BACKGROUND/SCENE CREATION**
```

└─ Detailed, photorealistic backgrounds?
  └─ **Flux 2 Pro**

CONCEPT ART / CREATIVE WORK
└─ Need artistic interpretation?
  ├─ Stylized → **Seedream 4.5**
  └─ Conceptual/abstract → **GPT Image 1.5**

Decision Tree 2: VIDEO GENERATION (Standard)

Start with: **What's your primary need?**

QUICK SOCIAL MEDIA CLIPS (TikTok/Reels, <15 sec)
└─ Speed critical?
  ├─ YES → **Kling V3** (fastest, good quality)
  ├─ Need audio → **Gemini Veo 3.1** (native audio)
  └─ Stylistic control → **Sora 2 Pro**

CINEMATIC/NARRATIVE SEQUENCES (15-30 sec)
└─ Photorealistic → **Gemini Veo 3.1** (premium quality, natural movement)
└─ Stylized/creative → **Sora 2 Pro** (artistic control)

PRODUCT DEMONSTRATIONS
└─ Professional showcase → **Gemini Veo 3.1 Reference** (maintains visual style)
└─ Quick demo → **Kling V3** (faster)

AVATAR-DRIVEN CONTENT (Talking head style)
└─ Using reference images → **Gemini Veo 3.1 Reference** (best consistency)

MUSIC VIDEOS / CREATIVE
└─ Maximum control → **Sora 2 Pro**

Decision Tree 3: VIDEO CHARACTER REPLACEMENT

Start with: **What motion are you replacing?**

EXISTING VIDEO → NEW CHARACTER
└─ Have reference video with specific choreography?
  ├─ YES, simple motion (walking, gesturing) → **Kling V2.6 Motion Control** ✓ BEST
  ├─ YES, complex choreography (dance) → **Kling V2.6 Motion Control** (test first)
  └─ NO → Need to generate motion from scratch
    └─ Use video generation models above + avatar image

STATIC IMAGE → ANIMATION

└─ Animate multiple poses?
  └─ **Kling O3 Image-to-Video** (frame-by-frame animation)

STYLE CONSISTENCY ACROSS SCENES
└─ Multiple scenes, same avatar?
  └─ **Kling O3 Reference-to-Video** (style-guided)

Quick Reference Matrix

Task	Primary Models	Speed	Cost	Best For
Avatar Creation	Flux 2 Pro, Nano Banana Pro	Medium	Low-Med	Character consistency
Quick Social Clip	Kling V3	Fast	Low	TikTok, fast turnaround
Cinematic Video	Gemini Veo 3.1	Slow	Medium	Premium quality, realistic
Character Replacement	Kling V2.6 Motion	Medium	Medium	Reusing choreography
Product Demo	Flux 2 Pro + Gemini Veo 3.1	Medium	Medium	Professional showcase
Artistic Content	Seedream 4.5 + Sora 2 Pro	Medium	Medium	Creative control

Using Genspark's Auto-Select vs. Manual Selection

Use AUTO-SELECT When:
- You want fastest processing
- - You're exploring ideas (no specific model preference)
- - Testing quality before manual tuning
- - Budget is your main concern

Use MANUAL SELECTION When:
- You need consistency (same model for series)
- - Specific visual style required (Seedream for artistic work)
- - You know which model works best for your use case
- - Quality is more important than speed

—

PART 4: PROMPT ENGINEERING MASTER GUIDE FOR GENSPARK

Leveraging Auto Prompt + Super Agent + Manual Refinement

Genspark offers three levels of prompt sophistication. Understanding when to use each gets you 10x better results:

Level 1: Auto Prompt (Fastest, Easiest)

What It Does:
Automatically enhances basic descriptions with technical details, style keywords, and quality specifications.

Input Example:
“Woman in a professional outfit demonstrating a tech product”

Auto Prompt Output:
“Professional woman, 30s, business casual attire, demonstrating tech product, confident expression, well-lit corporate environment, clean background, 4K professional photography, sharp focus, natural lighting”

Best For:
- Quick variations
- - When you’re unsure of technical specifications
- - Exploring multiple styles rapidly
- - Avatar generation where precision is secondary

Claude’s Role:
- Enable Auto Prompt for exploration phase
- - Review enhanced prompts to ensure direction matches your intent
- - Use Auto Prompt outputs as base for manual refinement

Level 2: Super Agent (Balanced Approach)

What It Does:
Interprets your description and generates fully optimized prompts for video/images, including model-specific parameters.

Input Example:
“Create a 15-second TikTok video of a woman using our fitness app, energetic and motivating”

Super Agent Expansion:
- Identifies optimal model (Kling V3 for speed)
- - Generates detailed prompt: “Energetic woman, 20s-30s, fitness setting, using mobile app, motivational expression, dynamic movement, bright professional lighting, TikTok format (9:16), 15 seconds, upbeat modern aesthetic, 720p resolution, high energy”
- - Suggests settings: Frame rate, duration, aspect ratio
- - Recommends post-processing approach

Best For:
- Professional content creation
- - When you have clear goals but want AI to optimize technical details
- - Batch processing (Super Agent handles multiple variations)
- - Balance between speed and quality

Claude’s Role:
- Provide clear creative brief to Super Agent
- - Review Super Agent’s technical interpretation
- - Request adjustments if Super Agent missed nuances
- - Approve final prompt before generation

Level 3: Manual Prompt Engineering (Maximum Control)

When You Need It:

- Highly specific brand consistency
- - Complex scenes with multiple subjects
- - When Auto/Super Agent options don't capture your vision
- - Iterative refinement based on specific feedback

—

The Optimal Prompt Formula for Each Task Type

IMAGE PROMPTS: The Avatar Formula

Structure:
[Identity + Age] + [Visual Style] + [Clothing] + [Expression] + [Context] + [Technical Specs]

Example Template:
"[Professional woman, 28 years old], [modern, sophisticated], [wearing tailored blazer in navy blue], [confident, approachable smile], [clean studio background with soft gradient], [4K professional photography, sharp focus, natural lighting, highly detailed face, commercial photography quality]"

Why This Order Works:

1. Identity first - establishes WHO
2. 2. Style second - establishes aesthetic direction
3. 3. Clothing - brand/context specific
4. 4. Expression - personality/tone
5. 5. Context - environment/setting
6. 6. Technical specs - quality parameters

Critical: Use Specific Descriptors
❌ Wrong: "attractive woman"
✓ Right: "woman with sharp jawline, clear skin, natural makeup, intelligent expression"

❌ Wrong: "nice background"
✓ Right: "soft-focus white background with subtle shadow, studio lighting setup"

VIDEO PROMPTS: The Scene Formula

Structure:
[Subject] + [Action/Movement] + [Setting] + [Visual Style] + [Duration/Pacing] + [Camera Work] + [Technical Specs]

Example Template:

“[Woman in professional attire], [walking while reviewing mobile device, then looking up with realization], [modern office environment with floor-to-ceiling windows and afternoon sunlight], [cinematic, professional, modern aesthetic], [10 seconds total, paced to match audio], [steady camera following slight motion, shallow depth of field], [1080p, 24fps, natural color grading, subtle professional tone]”

Pro Tips:

- Always specify duration (Genspark varies 2-30 seconds)
- - Describe movement clearly (“walks across frame”, “turns to camera”)
- - Mention pacing relative to audio if syncing
- - Include camera technique (static, dolly, pan)
- - Specify emotional tone (energetic, calm, urgent)

CHARACTER REPLACEMENT PROMPTS: The Motion Transfer Formula

When using Kling V2.6 Motion Control, your prompt should focus on character consistency, not motion (motion comes from reference video):

Structure:
[Character Description] + [Clothing/Styling] + [Lighting Match] + [Emotional Context]

Example:
“Professional woman avatar, consistent facial features from provided image, wearing matching outfit (black blazer, professional styling), matching studio lighting with soft shadows, confident and professional demeanor throughout motion sequence”

Key Difference:

- Don’t describe the ACTION (video provides it)
- - DO ensure character consistency specifications
- - DO match lighting of reference video
- - DO specify any personality tone

—

Common Prompt Mistakes (And How to Fix Them)

Mistake 1: Too Vague

❌ “Create a video of someone using a product”
✓ “Create a 12-second TikTok video: Woman in her 20s, professional casual outfit, holding wireless earbuds, inserting them in ear, happy surprised expression, modern apartment background, morning sunlight, energetic, high quality, 9:16 vertical, optimized for TikTok”

Why: Vague prompts = random results. Specific prompts = consistent results.

Mistake 2: Conflicting Styles

❌ “Photorealistic but with cartoon elements and watercolor effects”
✓ “Photorealistic with subtle artistic brushstroke overlay” (or pick ONE style clearly)

Why: Models struggle with conflicting artistic directions.

Mistake 3: Impossible Physics

❌ “Person levitating while walking naturally”
✓ “Person walking on tightrope with perfect balance, focused expression”

Why: Be clear about what’s physically happening.

Mistake 4: Over-Complicated Scenes

❌ “Woman with 5 people in background, multiple products, complex lighting, 3 different locations”
✓ “Woman in foreground (sharp focus) with blurred office background, holding one product, professional lighting”

Why: More isn’t better. Clearer simpler scenes = better quality.

Mistake 5: Missing Technical Specs

❌ “Make a cool video”
✓ “Make a cool 15-second video for TikTok (9:16 vertical), fast-paced, energetic, 720p minimum resolution, modern aesthetic”

Why: Technical specs prevent format issues and poor quality.

—

Iterative Refinement Strategy

First Generation Review:
Look at output and note:

- Did model understand the core concept? ✓/✗
- - Quality level acceptable? (1-10 scale)
- - Any major issues? (lighting, proportions, style)
- - Partially correct but needs adjustment?

Refinement Approach:

Issue	Refinement Strategy

Wrong person/subject	Describe person MORE specifically (facial features, age, body type)
Wrong style/aesthetic	Add style reference (“like magazine photography” or “editorial style”)
Wrong emotion/tone	Specify expression more clearly, add emotional context
Quality too low	Specify quality markers (“high detail”, “professional grade”, “4K sharp”)
Wrong background	Describe background specifically (“modern office with windows”, not “nice background”)
Proportions wrong	Use comparative references (“realistic proportions”, “anatomically correct”)
Inconsistent with brand	Add “matches brand aesthetic for [brand description]”

Iteration Limit:

- Avatar/image: 2-3 iterations max (then try different model)
- - Video: 1-2 iterations (then try different prompt approach)
- - Stop if: Fundamental model limitation (use different model instead)

—

Advanced: Prompt Components by Model Preference

Flux 2 Pro (Photorealistic)

- Heavy on: Lighting terms (“natural light”, “professional photography”, “studio lighting”)
- - Include: Specific camera settings (“85mm lens equivalent”, “f/2.8 aperture feel”)
- - Add: Technical photography terms (“bokeh”, “shallow depth of field”, “color graded”)

Example addition: “Shot on high-end mirrorless camera, professional color grading, magazine editorial quality”

Seedream 4.5 (Artistic/Stylized)

- Heavy on: Artistic style (“watercolor aesthetic”, “oil painting style”, “illustration”)
- - Include: Art movement references (“Art Deco”, “contemporary art”, “digital art”)
- - Add: Mood/atmosphere (“dreamlike”, “ethereal”, “cinematic”)

Example addition: “Artistic illustration style inspired by contemporary digital art, ethereal and sophisticated aesthetic”

Nano Banana Pro (Versatile/Fast)

- Balance: Not too specific (better with general descriptions)
- - Include: Core characteristics without over-specification
- - Add: Quality indicators (“well-composed”, “professional quality”, “clean aesthetic”)

Example addition: “Well-composed, professional quality, balanced aesthetic”

—

Using Claude to Manage Your Prompt Library

What Claude Can Track:

- Successful prompts for each model

- - Templates by content type (avatars, products, scenes)
- - Prompt variations that worked well
- - Prompts to avoid (didn't work)
- - Model performance for different tasks

System Setup for Claude:
"Keep a prompt performance log:

- [Prompt description] | Model: [which model] | Result: [rating 1-10] | Notes: [what worked/didn't work]
- - Use this log to suggest prompts for similar future tasks
- - Learn what makes prompts successful for my brand"

Example Log Entry:
"Product showcase video with avatar | Model: Gemini Veo 3.1 | Result: 9/10 | Notes: Very realistic motion, lighting consistent with avatar. Include 'seamless product presentation' in future similar prompts."

—

The Quick Start: Prompts by Platform

TikTok Video Prompt Template

"[Duration: 12-15 seconds], [9:16 vertical format], fast-paced energetic [action description], [vibrant colors/modern aesthetic], [trending audio-friendly pacing], [TikTok optimized for mobile viewing], 720p minimum, highly engaging"

Instagram Reel Prompt Template

"[Duration: 15-30 seconds], [9:16 vertical or 1:1 square], [polished professional aesthetic], [storytelling structure with clear beginning/middle/end], [brand-appropriate colors], [Instagram-optimized resolution: 1080p], smooth transitions between cuts"

LinkedIn Professional Content Prompt Template

"[Duration: 30-60 seconds], [16:9 horizontal format], [professional, credible tone], [corporate aesthetic], [clear messaging/educational value], [business professional attire/settings], [1080p], [authoritative but approachable]"

YouTube Shorts Prompt Template

"[Duration: 15-60 seconds], [9:16 vertical], [entertainment or educational focus], [high production quality], [attention-grabbing first 2 seconds], [professional color grading], [1080p-4K], [optimized for YouTube algorithm]"PART 2: CLAUDE COWORK INTEGRATION
PART 1: GENSPARK AI IMAGE AGENT

Overview
The Genspark AI Image agent is a powerful tool for generating, editing, and enhancing images using artificial intelligence. It combines multiple AI image generation models with intuitive editing capabilities.

Core Interface Components

1. Model Selection: “Nano Banana Pro”
- **Function**: Allows you to select different AI image generation models
- - **Available Models Seen**:
- - Nano Banana Pro (default)
- - Seedream 4.5
- - GPT Image 1.5
- - Flux 2 Pro
- - Z-Image Turbo
- - **Usage**: Click to switch between models for different style outputs and quality levels
- - **Best Practice**: Different models excel at different types of images:
- - Use Nano Banana Pro for quick, versatile generation
- - Try Flux 2 Pro for photorealistic and detailed results
- - Use Z-Image Turbo for faster processing
- - Choose GPT Image 1.5 for artistic and conceptual work
- - Try Seedream 4.5 for unique stylistic interpretations

2. Setting Button
- **Function**: Opens advanced configuration options for image generation
- - **Access**: Click the “Setting” button in the top control bar
- - **Likely Options** (based on standard image generation tools):
- - Resolution/Image Size settings
- - Quality/Detail levels
- - Aspect ratio selection
- - Generation parameters
- - Advanced AI settings

3. Auto Style Toggle
- **Function**: Automatically applies artistic styles to generated images
- - **Status**: Shown as “OFF” - can be toggled to ON
- - **Usage**: Enable this to automatically enhance images with artistic flair
- - **Benefit**: Saves time by eliminating manual style application steps

4. Camera Button
- **Function**: Allows uploading images from your camera or device
- - **Usage**: Click to take or import a photo to use as reference or for editing
- - **Applications**:
- - Upload reference images for style matching
- - Import images for background removal
- - Upload photos for enhancement and editing

5. Auto Prompt Button

- **Function**: Automatically generates optimized prompts based on your input
- - **Status**: Enabled/available
- - **Benefit**: Creates detailed, descriptive prompts that yield better results
- - **Best Practice**: Use this when you’re unsure how to describe your vision in detail

Quick Apps (Image Editing Tools)

The AI Image agent includes specialized quick-access editing tools:

1. Background Remover

- **Purpose**: Removes backgrounds from images seamlessly
- - **Best For**: Product photos, portraits, creating cutout assets
- - **How to Use**: Select this tool, upload image, automatic background removal applied
- - **Result**: Clean subject isolation without manual masking

2. Magic Eraser

- **Purpose**: Removes unwanted objects or people from images
- - **Best For**: Cleaning up photos, removing photobombers, product removal
- - **How to Use**: Select tool, upload image, select objects to erase
- - **Result**: Intelligently filled areas using content-aware technology

3. Magic Redraw

- **Purpose**: Intelligently redraws/regenerates portions of images
- - **Best For**: Fixing specific image areas, re-generating background elements
- - **How to Use**: Select tool, upload image, select area to redraw
- - **Result**: AI-regenerated section that blends seamlessly

4. Photo Unblur

- **Purpose**: Sharpens and clarifies blurry photos
- - **Best For**: Recovering detail from out-of-focus shots, old photos
- - **How to Use**: Select tool, upload blurry image
- - **Result**: Enhanced clarity and sharpness

5. Image Expand

- **Purpose**: Extends image boundaries with AI-generated content
- - **Best For**: Expanding composition, changing aspect ratios, adding canvas
- - **How to Use**: Select tool, upload image, define expansion area
- - **Result**: Seamlessly expanded image maintaining original style

Prompt Engineering Tips for AI Image

General Principles

1. **Be Specific**: Instead of “cat”, use “fluffy orange tabby cat lounging on velvet armchair”
2. 2. **Include Style References**: Add art styles - “oil painting style”, “photorealistic”, “cyberpunk aesthetic”
3. 3. **Specify Lighting**: “golden hour sunlight”, “neon glow”, “dramatic backlighting”
4. 4. **Set Mood/Atmosphere**: “serene”, “dystopian”, “whimsical”, “mysterious”
5. 5. **Include Composition Details**: “wide-angle shot”, “close-up portrait”, “overhead view”

Advanced Techniques

- **Combining Concepts**: “Viking warrior meets cyberpunk, futuristic armor, ancient symbols”
- - **Quality Modifiers**: “highly detailed”, “4K quality”, “intricate details”, “professional photography”
- - **Negative Space**: Describe what NOT to include - helps model avoid unwanted elements
- - **Reference Artists/Styles**: “in the style of Studio Ghibli”, “inspired by Art Deco”, “hyperrealistic like 3Ddepth”

Workflow Examples

Example 1: Creating Product Photos

1. Write detailed product description with lighting preference
2. 2. Generate base image using Flux 2 Pro (for photorealism)
3. 3. If background cluttered, use Background Remover
4. 4. Use Magic Redraw for any imperfect areas
5. 5. If needed, use Image Expand to adjust composition
6. 6. Export final result

Example 2: Creating Concept Art

1. Use Seedream 4.5 or GPT Image 1.5 for artistic styles
2. 2. Write detailed conceptual prompt
3. 3. Enable Auto Style for enhanced aesthetics
4. 4. Generate multiple variations
5. 5. Use Magic Eraser or Magic Redraw to combine best elements
6. 6. Further refine with additional generations

Image Recents & History

- **Location**: Bottom section of interface
- - **Function**: Displays recently generated and edited images
- - **Access**: Click “View all” to see complete history
- - **Benefit**: Reference your creation history and quickly access previous work

—

PART 2: GENSPARK AI VIDEO AGENT

Overview

The Genspark AI Video agent enables creation of dynamic video content from text descriptions. It transforms ideas into animated visual sequences.

Core Interface Components

1. Model Selection: “Gemini Veo 3.1”

- **Function**: Selects the AI video generation model
- - **Available Model**: Gemini Veo 3.1 (Google’s advanced video model)
- - **Characteristics**:
- - State-of-the-art video generation

- - Capable of handling complex scenes
- - Produces natural motion and transitions
- - Excellent for realistic scenarios and dynamic movement
- - **Best For**: Cinematic shots, complex narratives, photorealistic scenarios

2. Setting Button

- **Function**: Opens video generation configuration options
- - **Likely Options** (based on standard video generation):
- - Video resolution (720p, 1080p, 4K)
- - Frame rate (24fps, 30fps, 60fps)
- - Codec settings
- - Export format options
- - Quality/processing settings
- - Advanced generation parameters

3. Duration Control: “4s”

- **Function**: Sets the length of generated video
- - **Default**: 4 seconds
- - **Adjustable**: Likely clickable to change duration
- - **Typical Range**: Usually 2-60 seconds depending on plan
- - **Best Practice**:
- - Use 4-6 seconds for highlights/clips
- - Use 15-30 seconds for scenes or story segments
- - Longer videos may require more processing time
- - Consider your narrative - don’t make unnecessarily long

4. Auto Prompt Button

- **Function**: Automatically enhances video descriptions into detailed prompts
- - **Status**: Available/enabled
- - **Benefit**: Creates cinematically-optimized descriptions
- - **Usage**: Helpful when you have a rough idea but need professional-level prompting

5. Assets Button

- **Function**: Access library of pre-made visual assets, templates, or stock elements
- - **Usage**: Click to browse assets that can be incorporated or referenced
- - **Benefit**: Jumpstart video creation with professional base elements

Video Generation Workflow

Basic Steps

1. Click “Describe the story or scene for your video” text box
2. 2. Write detailed video description/prompt
3. 3. Adjust duration if needed (default 4s)
4. 4. Use Auto Prompt to enhance description
5. 5. Click Generate/Create
6. 6. Wait for video processing (varies by duration and model load)
7. 7. Review generated video
8. 8. Export or regenerate if needed

Prompt Engineering for AI Video

Essential Video Prompts Include:

1. **Scene Setting**: Location, environment, time of day
2. 2. **Movement & Action**: What's happening, motion types, pacing
3. 3. **Visual Style**: Cinematic, documentary, animated, realistic
4. 4. **Camera Work**: Static shot, pan, zoom, tracking movements
5. 5. **Mood/Tone**: Emotional undertone, energy level
6. 6. **Key Elements**: Objects, characters, visual focal points

Video Prompt Formula

[Subject/Scene] [Setting/Location] [Lighting/Time] [Movement/Action] [Style] [Camera Work] [Mood/Emotion]

Examples

Example 1 - Cinematic Nature
"Drone footage of a misty mountain landscape at sunrise, camera slowly ascending to reveal snow-capped peaks, warm golden light breaking through clouds, peaceful and majestic, 4K quality"

Example 2 - Abstract/Creative
"Morphing liquid metal shapes flowing and transforming, vibrant neon colors shifting between blue and purple, smooth continuous motion, sleek futuristic aesthetic, close-up perspective, energetic yet fluid"

Example 3 - Narrative Scene
"A chef preparing sushi at counter with expert precision, hands moving swiftly, fresh ingredients visible, warm kitchen lighting, quick cuts between knife work and finished rolls, professional documentary style, 6 seconds"

Example 4 - Product Showcase
"Luxury watch rotating slowly on black marble platform, catching light on polished chrome surfaces, light rays highlighting details, smooth 360-degree rotation, premium product photography style, dramatic lighting"

Video Best Practices

For Quality Results:

1. **Specificity Matters**: "Bird flying through forest" vs "Red cardinal flying through autumn forest with golden sunlight filtering through leaves"
2. 2. **Motion Descriptions**: Clearly describe movement - "quick", "smooth", "jerky", "floating", "accelerating"
3. 3. **Perspective**: Specify camera angle - "overhead view", "eye-level", "low angle looking up", "bird's eye view"

4. 4. **Duration Appropriate**: Match video length to concept - quick cuts need shorter clips, cinematic shots benefit from 8-15 seconds
5. 5. **Technical Terms**: Use filmmaking language - “Pan”, “Dolly”, “Tracking shot”, “Tilt”, “Zoom”
6. 6. **Reference Style**: Mention inspiration - “like a Netflix opening sequence”, “documentary style”, “music video vibe”

Common Mistakes to Avoid:

1. ❌ Vague descriptions (“make a cool video”)
2. 2. ❌ Conflicting instructions (contradictory actions)
3. 3. ❌ Impossible physics (unless intentionally surreal)
4. 4. ❌ Too much dialogue/text in video-only medium
5. 5. ❌ Overly complex multi-scene narratives in single shot

Video Export & Usage

- **Format**: Typically MP4 or WebM
- - **Resolution**: Adjustable per settings
- - **Frame Rate**: Selectable based on intended use
- - **Applications**: Social media, presentations, marketing, storytelling, creative projects
- - **Optimization**: Consider platform specifications (TikTok, YouTube, Instagram, etc.)

—

PART 3: INTEGRATED WORKFLOWS - IMAGE + VIDEO

Combined Project Strategies

Workflow 1: Visual Story Sequence

1. Generate key frame images using AI Image for storyboarding
2. 2. Use Image Expand to create panoramic compositions
3. 3. Create video clips showing transitions between key moments
4. 4. Combine in external editor for full narrative

Workflow 2: Product Marketing Campaign

1. Generate product showcase images with various angles (AI Image)
2. 2. Create 4-6 second product demonstration video (AI Video)
3. 3. Use Background Remover for consistency across media
4. 4. Create video thumbnail from best image

Workflow 3: Abstract/Artistic Series

1. Generate concept images with specific style (AI Image)
2. 2. Create video that animates similar concept (AI Video)
3. 3. Use Image Expand to create variations
4. 4. Build cohesive visual collection with consistent aesthetic

—

PART 4: OPTIMIZATION & ADVANCED TIPS

Quality Maximization Checklist

- [ ] Use specific, detailed descriptions (minimum 20-30 words)
- - [ ] Include style references and artistic inspiration
- - [ ] Specify lighting conditions explicitly
- - [ ] Mention quality/resolution requirements
- - [ ] Use comparative references (“like X but with Y”)
- - [ ] Test different models to compare results
- - [ ] Iterate and refine based on initial outputs

Efficiency Strategies

1. **Batch Generation**: Create multiple versions simultaneously
2. 2. **Template Prompts**: Develop reusable prompt structures
3. 3. **Model Matching**: Know which model excels at your specific needs
4. 4. **Quick Tools**: Use Quick Apps for common editing needs
5. 5. **Asset Library**: Organize successful prompts for future use

Common Use Cases

Social Media Content

- Short 4-6 second videos for TikTok, Reels, Shorts
- - Square or vertical format optimized for mobile
- - Energetic, trend-focused content

Marketing & E-Commerce

- Product showcase images and videos
- - Lifestyle imagery showing product in use
- - Before/after transformations

Creative & Artistic

- Concept art exploration
- - Abstract visual experiments
- - Style studies and variations

Educational & Explanatory

- Visual demonstrations
- - Process videos
- - Conceptual illustrations

Design & Branding

- Logo concept variations
- - Brand aesthetic exploration
- - Design system components

—

PART 5: TROUBLESHOOTING & TIPS

Common Issues & Solutions

Issue: Generated image doesn’t match description
Solution:

- Rewrite with more specific details

- - Add style references explicitly
- - Try different model
- - Use Auto Prompt for better phrasing
- - Increase word count in description

Issue: Video generation takes too long
Solution:

- Reduce video duration
- - Simplify scene description
- - Check system load
- - Try again during off-peak hours

Issue: Image quality seems low
Solution:

- Check resolution settings
- - Add “high quality”, “detailed”, “4K” to prompt
- - Switch to higher-quality model
- - Request higher resolution in settings

Issue: Unwanted background elements in images
Solution:

- Use Background Remover tool
- - Use Magic Eraser to remove specific objects
- - Regenerate with explicit background description
- - Add “clean background” or “white background” to prompt

Advanced Tips

1. **Iterative Refinement**: Generate variations, pick best, refine further
2. 2. **Prompt Archaeology**: Study what worked in past successes
3. 3. **Model Experimentation**: Test all models with same prompt
4. 4. **Aspect Ratio Strategy**: Use Image Expand for composition changes
5. 5. **Style Consistency**: Maintain visual language across projects
6. 6. **Negative Prompting**: Explicitly state what NOT to include
7. 7. **Lighting Precision**: Describe exact lighting conditions desired

—

PART 6: GENSPARK WORKSPACE INTEGRATION

Accessing Your Agents

- **From Home**: Navigate to Genspark Home
- - **From Sidebar**: Click “AI Image” or locate “AI Video” in agent menu
- - **From Dashboard**: Both agents appear in agent carousel
- - **Shortcut**: Use “New” button to quickly create in either agent

Organizing Your Work

- **Recents Section**: Automatically saves recent generations
- - **View All**: Access complete history of all images created
- - **Saving**: All work auto-saves to Genspark cloud

- - **Export**: Download results in various formats

Collaboration Features

- **Share Results**: Export and share images/videos
- - **Team Access**: Work within Genspark teams
- - **History Tracking**: Reference past creations
- - **Asset Organization**: Build personal asset library

—

FINAL RECOMMENDATIONS FOR CLAUDE COWORK

When Claude Cowork guides you using these agents:

1. **Start Detailed**: Provide clear, specific requests with context
2. 2. **Iterate Mindfully**: Use feedback to refine prompts progressively
3. 3. **Experiment**: Try different models and settings
4. 4. **Document Success**: Note prompts and settings that work well
5. 5. **Combine Tools**: Use Quick Apps to enhance base generations
6. 6. **Plan Ahead**: Think about end use (social media, print, etc.)
7. 7. **Quality Over Quantity**: Better to perfect one image than generate many mediocre ones

—

Resources & Quick Reference

Model Selection Guide:

- Nano Banana Pro: Versatile, balanced results
- - Seedream 4.5: Artistic, stylized
- - GPT Image 1.5: Creative, conceptual
- - Flux 2 Pro: Photorealistic, detailed
- - Z-Image Turbo: Fast processing

Video Duration Guide:

- 2-4 seconds: Quick clips, highlights
- - 5-10 seconds: Short scenes, transitions
- - 15-30 seconds: Full sequences, narratives
- - 30+ seconds: Complete stories, demonstrations

Prompt Length: 30-100 words optimal for best results
